Architecture

Architecture
The project uses libGDX with two Gradle modules: **lwjgl3** (desktop launcher) and **core** (the whole game).
`Main` opens `GameScreen`, which owns every system and runs the game loop.

- **entities**: Entity, Enemy, Zombie, Military, Player, Bullet
- **items**: Items, Weapon, Pistol, Rifle, MilitaryWeapon
- **factory**: EnemiesManager, BulletManager (create, update and remove objects)
- **collisions**: GameContactListener (Box2D contacts → damage)
- **world**: MapManager, PlayerSpawner, MapEvents, SleepEvent, TravelCutscene (Tiled maps, spawns, doors)
- **system**: WeaponController, CameraController, BulletOwner
- **render**: GameRenderer, LightManager, PostProcess, one renderer per character
- **audio**: SoundManager

Libraries: libGDX, Box2D (physics), box2dlights (lights and shadows), Tiled (.tmx maps).
Game logic and drawing are separated: entities hold the logic, renderers draw them.
